

1. **Identify the main components of the system.** The system consists of a **client** and a **server**. The client is responsible for sending requests to the server, and the server is responsible for processing these requests and returning responses.

2. **Describe the flow of data.** Data flows from the client to the server via a network connection. The client sends a request, and the server responds with data.

3. **Explain the role of the server.** The server's role is to receive requests from the client, process them, and return the appropriate response. It acts as the central hub for the system.

4. **Discuss the importance of security.** Security is a critical concern in this system. It is essential to ensure that data is transmitted securely and that the server is protected from unauthorized access.

5. **Summarize the overall architecture.** The system is a client-server architecture. The client initiates requests, and the server processes them and returns responses. The entire system is designed to be secure and efficient.
